

## Oncology Prognosticator

Dataset Information:

Target variable (y):

- Diagnosis (M = malignant, B = benign)

Ten features (X) are computed for each cell nucleus:

1. radius (mean of distances from center to points on the parimeter)
2. texture (standard deviation of gray-scale values)
3. perimeter
4. area
5. smothness (local variation in radius lengths)
6. compactness ( $\text{perimeter}^2/\text{area}-1.0$ )
7. concave points (number of concave portions of the contour)
8. concavity(severity of concave portions of the contour)
9. symmetry
10. fractal dimension (coastline approximation - 1)

For each characteristic three measures are given:

1. Mean
2. Standard error
3. Largest/ Worst

```
import pandas as pd
```

```
cancer = pd.read_csv('https://github.com/YBIFoundation/Dataset/raw/main/Cancer.csv')
```

```
cancer.head()
